Metodo di analisi: Next Generation Sequencing (NGS)

Strategia diagnostica:

Data inizio analisi: 05/10/2015

Data fine analisi: 23/10/2015

Risultati e Conclusioni

Risultato: - gene TGM1 (Ichthyosis, lamellar):
Presenza della mutazione V518M (c.1552 G>A) in eterozigosi. [rs35312232]

- gene NPC2 (Niemann-Pick type C2 disease):
Presenza della mutazione V30M (c.88 G>A) in eterozigosi. [rs151220873]

Interpretazione: Il campione in esame presenta le mutazioni:

V518M (c.1552 G>A) in ETEROZIGOSI a livello del gene TGM1.
Ref:Hennies (1998) Am J Hum Genet 62, 1052

V30M (c.88 G>A) in ETEROZIGOSI a livello del gene NPC2.
Ref:Park (2003) Hum Mutat 22, 313

Note tecniche: Relazione tecnica in allegato

Commenti:

Suggerimenti: L'esame effettuato ha prodotto un risultato per il quale è consigliabile un colloquio di approfondimento con uno specialista in genetica medica.

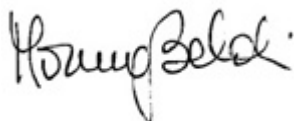

Risultati verificati da: Giuliano Cottone **Data verifica :** 21/10/2015

Risultati validati da: Francesco Fiorentino **Data validazione :** 23/10/2015

GeneScreen[®] Analisi multipla di 724 malattie genetiche ereditarie

PROSPETTO DELL'ANALISI

Paziente	
Tipo Campione	Prelievo Ematico
Codice Campione	B54378
Metodo	Next Generation Sequencing (NGS)
Analisi	GeneScreen® - Analisi Malattie Ereditarie mediante sequenziamento NGS

Conclusioni

- gene TGM1 (Ichthyosis, lamellar):

Presenza della mutazione V518M (c.1552 G>A) in eterozigosi.[rs35312232]

- gene NPC2 (Niemann-Pick type C2 disease):

Presenza della mutazione V30M (c.88 G>A) in eterozigosi.[rs151220873]

La genomica di nuova generazione

Negli ultimi anni, gli straordinari progressi conseguiti nel settore della genomica e delle biotecnologie hanno posto le basi per leggere e comprendere le informazioni contenute nel nostro DNA, il **genoma**. In particolare **le nuove tecnologie di sequenziamento, Next Generation Sequencing (NGS)**, ci permettono oggi di accedere alla sequenza del nostro DNA in modo più facile ed efficace, fornendo una valutazione approfondita dell'informazione genetica di ogni singolo individuo.

Ogni persona nasce, infatti, con caratteristiche genetiche che la differenziano dagli altri e che la rendono unica. Mentre la maggior parte delle differenze nella sequenza del DNA tra persone diverse è innocua, alcuni cambiamenti, definiti **mutazioni genetiche**, possono alterare la funzionalità genomica e rendere quella persona portatrice di una specifica malattia genetica trasmissibile ai propri figli.

I portatori di malattie genetiche sono tipicamente individui sani, completamente privi di sintomi ed inconsapevoli di essere a rischio di trasmettere tale "errore" del DNA ai figli.

Il test GeneScreen[®]

GeneScreen[®] è un test diagnostico, sviluppato da GENOMA Group, che permette di eseguire un'analisi multipla di **oltre 700 malattie genetiche ereditarie**, tra cui quelle più frequenti nella popolazione italiana, come la Fibrosi Cistica, l'Anemia Falciforme, la Talassemia, la Sordità Ereditaria, etc.

GeneScreen[®] consente alla coppia di conoscere, attraverso l'analisi del loro DNA, se si è portatori di gravi malattie genetiche. Il test, quindi, permette di identificare le coppie a rischio di trasmettere ai loro figli una specifica malattia genetica.

Indicazioni al test GeneScreen[®]

GeneScreen[®] è indicato:

- Per le coppie che progettano di diventare genitori, sia tramite concepimento naturale che mediante l'accesso a tecniche di procreazione medicalmente assistita (PMA);
- Per le coppie che sono in attesa di un figlio, e che desiderano ridurre il rischio di trasmettere a quest'ultimo una malattia genetica ereditaria;
- Per le coppie che fanno ricorso a tecniche di fecondazione eterologa, al fine di individuare un donatore di gameti che non sia portatore di mutazioni nei medesimi geni riscontrate in uno dei partners della coppia.

L'esame può essere effettuato su un singolo individuo o, preferibilmente, su **entrambi i partners** della coppia.

Come viene effettuato il test GeneScreen[®]?

Il test viene eseguito mediante il prelievo di un campione ematico. Tramite un'analisi complessa di laboratorio, il DNA viene isolato dalle cellule nucleate ed **amplificato mediante tecnica PCR**. Successivamente, attraverso un processo tecnologico avanzato di **sequenziamento massivo parallelo (MPS)**, che impiega tecniche di **Next Generation Sequencing (NGS)** utilizzando sequenziatori **ILLUMINA**, si sequenziano completamente **550 geni** (esoni e regioni introniche adiacenti, ± 5 nucleotidi) (Tabella 1) ad elevata profondità di lettura. Le sequenze geniche ottenute vengono analizzate attraverso un'**avanzata analisi bioinformatica**, per determinare la presenza di eventuali mutazioni nei geni in esame.

I geni elencati in Tabella 1, sono stati selezionati in base all'incidenza nella popolazione delle malattie causate da mutazioni in tali geni, alla gravità del fenotipo clinico alla nascita ed all'importanza del quadro patogenetico associato, seguendo le indicazioni dell'American College of Medical Genetics (ACMG) (Grody et al., Genet Med 2013;15:482-483).

Risultati ottenibili con il test **GeneScreen**[®]

“**POSITIVO**” – **Presenza di una o più mutazioni:** indica che il test ha rilevato una o più mutazioni a livello di uno (o più) geni. Il nostro genetista, in sede di consulenza genetica, spiegherà in maniera dettagliata il significato del risultato del test ed, eventualmente, prospetterà la necessità di estendere l'esame all'altro partner della coppia, al fine di verificare che quest'ultimo non sia portatore della medesima malattia genetica, nel qual caso si ravviserebbe un rischio di trasmissione della patologia ai figli.

Le mutazioni riscontrabili tramite il test **GeneScreen**[®] possono rientrare nelle seguenti categorie prognostiche:

- **con significato patologico noto;**
- **con significato benigno** in quanto sono riscontrabili in individui normali e sono prive di significato patologico;
- **con significato incerto** in quanto non ancora note o caratterizzate dalla comunità medico-scientifica.

Se entrambi i partners della coppia dovessero risultare positivi per il test, portatori di una mutazione con significato patologico noto nel medesimo gene, il nostro genetista potrà fornire una panoramica sulle opzioni diagnostiche attualmente disponibili per verificare lo stato di salute del feto, in caso di futura gravidanza.

“**NEGATIVO**” - **Assenza di mutazioni:** indica che il test non ha rilevato la presenza di mutazioni nei geni esaminati.

Parametri utilizzati per la refertazione delle varianti genetiche

L'analisi è mirata esclusivamente ai geni elencati in Tabella 1. Verranno refertate solo le mutazioni classificate come a significato patogenetico noto o con significato incerto, sulla base dei dati della letteratura scientifica e la classificazione presente nel database di riferimento Human Gene Mutation Database (HGMD), aggiornato alla data del prelievo. Inoltre, seguendo le indicazioni dell'American College of Medical Genetics (ACMG), sono state considerate come patogenetiche o presunte patogenetiche solo le mutazioni con un valore di Minor Allele Frequency (MAF) <5% (1000 Genomes Project), riferibile come la frequenza di ricorrenza dell'allele meno comune all'interno della popolazione.

Target Coverage

Si intende per *Target Coverage*, il numero medio di letture (*reads*) ottenute dal sequenziamento per ciascuna base nucleotidica costituente il gene. Le varianti con una profondità di lettura

(numero di reads) inferiore a 30X non sono evidenziate dall'algoritmo di analisi bioinformatica.

Accuratezza del test GeneScreen[®]

Le tecniche attuali di sequenziamento del DNA producono risultati con un'accuratezza superiore al 99%. Benché questo test sia molto accurato bisogna sempre considerare i limiti dell'esame, di seguito descritti.

Limiti del test GeneScreen[®]

Questo esame valuta solo le malattie genetiche ed i geni elencati in Tabella 1. Il test non evidenzia altre malattie genetiche o geni non specificamente investigati.

L'esame inoltre non è in grado di evidenziare:

- mutazioni localizzate nelle regioni introniche oltre ± 5 nucleotidi dai breakpoints;
- delezioni, inversioni o duplicazioni maggiori di 20 bp;
- mosaicismi della linea germinale (cioè mutazioni presenti solo nei gameti).

Un risultato "**NEGATIVO**" - **Assenza di mutazioni** per i geni investigati non esclude la possibilità di essere portatori di una mutazione localizzata in una regione del genoma non investigata dall'esame.

E' possibile che alcune zone del proprio DNA non possano essere sequenziate o che abbiano una copertura inferiore ai limiti fissati dagli esperti di GENOMA Group per garantire un'analisi accurata delle varianti. Queste regioni non saranno quindi comprese nell'analisi qualora non superino gli standard qualitativi richiesti.

In alcuni casi, il risultato di un'analisi genomica può rivelare una variante o mutazione del DNA con un significato clinico non certo o determinabile in base alle attuali conoscenze medico-scientifiche.

L'interpretazione delle varianti genetiche si basa sulle più recenti conoscenze disponibili al momento dell'analisi. Tale interpretazione potrebbe cambiare in futuro con l'acquisizione di nuove informazioni scientifiche e mediche sulla struttura del genoma ed influire sulla valutazione stessa delle varianti.

Alcune patologie possono essere causate o regolate da più di una variante nel suo DNA in uno o più geni. Alcune di queste varianti possono non essere ancora state identificate o validate dalla comunità scientifica e quindi non essere riportate come patogenetiche al momento dell'analisi.

Limite intrinseco della metodologia NGS utilizzata è la mancanza di uniformità di coverage per ciascuna regione genica analizzata. Tale limite si traduce nella possibilità, insita nelle metodiche NGS, che specifiche mutazioni dei geni selezionati potrebbero non essere state rilevate dal test.

Tabella 1: GeneScreen[®] - Elenco dei geni analizzati e della malattie genetiche investigate

1	17-alpha-hydroxylase/17,20-lyase deficiency	202110	<i>CYP17A1</i>
2	17-beta-hydroxysteroid dehydrogenase X deficiency	300438	<i>HSD17B10</i>
3	3-beta-hydroxysteroid dehydrogenase, type II, deficiency	201810	<i>HSD3B2</i>
4	3-hydroxy-3-methylglutaric aciduria	246450	<i>HMGCL</i>
5	3-methylglutaconic aciduria type 1	250950	<i>AUH</i>
6	3-methylglutaconic aciduria type 3	258501	<i>OPA3</i>
7	46XY sex reversal 3	612965	<i>NR5A1</i>
8	4-hydroxybutyric aciduria	271980	<i>ALDH5A1</i>
9	Aarskog-Scott syndrome	305400	<i>FGD1</i>
10	ABCD syndrome	600501	<i>EDNRB</i>
11	Achalasia-addisonianism-alacrimia syndrome	231550	<i>AAAS</i>
12	Achondrogenesis type 1B	600972	<i>SLC26A2</i>
13	Acyl-CoA dehydrogenase 9 deficiency	611126	<i>ACAD9</i>
14	Adrenal hyperplasia, congenital, due to 11-beta-hydroxylase deficiency	202010	<i>CYP11B1</i>
15	Adrenal insufficiency, congenital, with 46XY sex reversal, partial or complete	613743	<i>CYP11A1</i>
16	Adrenocortical insufficiency	612965	<i>NR5A1</i>
17	Adrenoleukodystrophy	300100	<i>ABCD1</i>
18	Adult neuronal ceroid lipofuscinosis	256730	<i>PPT1</i>

19	Adult neuronal ceroid lipofuscinosis 10	610127	CTSD
20	Adult neuronal ceroid lipofuscinosis 4A	204300	CLN6
21	Aicardi-Goutières syndrome	225750	TREX1
22	Aicardi-Goutieres syndrome 2	610181	RNASEH2B
23	Aicardi-Goutieres syndrome 3	610329	RNASEH2C
24	Aicardi-Goutieres syndrome 4	610333	RNASEH2A
25	Aicardi-Goutieres syndrome 5	612952	SAMHD1
26	Aldosteronism, glucocorticoid-remediable	103900	CYP11B1
27	Allan-Herndon-Dudley syndrome	300523	SLC16A2
28	Alpers syndrome	203700	POLG
29	Alpha-methylacyl-Coa Racemase deficiency	614307	AMACR
30	Alpha-thalassemia	604131	HBA1
31	Alpha-thalassemia myelodysplasia syndrome, somatic	300448	ATRX
32	Alpha-thalassemia/mental retardation syndrome	301040	ATRX
33	Alport syndrome	301050	COL4A5
34	Alport syndrome autosomal recessive (gene COL4A3)	203780	COL4A3
35	Alport syndrome autosomal recessive (gene COL4A4)	203780	COL4A4
36	Alström syndrome	203800	ALMS1
37	Amish infantile epilepsy syndrome	609056	ST3GAL5
38	Amyotrophic lateral sclerosis 2, juvenile	205100	ALS2
39	Anauxetic dysplasia	607095	RMRP
40	Angelman syndrome	105830	UBE3A
41	Antenatal Bartter syndrome	241200	KCNJ1
42	Antenatal Bartter syndrome type 1	601678	SLC12A1

43	Antley-Bixler syndrome with genital anomalies and disordered steroidogenesis	201750	POR
44	Aplasia/hypoplasia of limbs and pelvis	276820	WNT7A
45	Aplastic anemia	609135	NBN
46	Apparent mineralocorticoid excess	218030	HSD11B2
47	Argininosuccinic aciduria	207900	ASL
48	Aromatic L-amino acid decarboxylase deficiency	608643	DDC
49	Arthrogryposis - renal dysfunction - cholestasis	208085	VPS33B
50	Arthrogryposis, renal dysfunction, and cholestasis 2	613404	VIPAR
51	Ataxia - oculomotor apraxia type 1	208920	APTX
52	Ataxia with vitamin E deficiency	277460	TTPA
53	Ataxia-telangiectasia	208900	ATM
54	Atelosteogenesis type II	256050	SLC26A2
55	Autism, susceptibility to, X-linked 5	300847	RPL10
56	Autoimmune lymphoproliferative syndrome, type IA	601859	FAS
57	Autoimmune lymphoproliferative syndrome, type IB	601859	FASLG
58	Autoimmune lymphoproliferative syndrome, type II	603909	CASP10
59	Autoimmune polyendocrinopathy syndrome , type I, with or without reversible metaphyseal dysplasia	240300	AIRE
60	Autosomal dominant Charcot-Marie-Tooth disease type 2K	607831	GDAP1
61	Autosomal recessive ataxia due to ubiquinone deficiency	612016	ADCK3

62	Autosomal recessive Charcot-Marie-Tooth disease with hoarseness	607706	<i>GDAP1</i>
63	Autosomal recessive distal spinal muscular atrophy type 4	611067	<i>PLEKHG5</i>
64	Autosomal recessive dopa-responsive dystonia	605407	<i>TH</i>
65	Autosomal recessive hypophosphatemic rickets 1	241520	<i>DMP1</i>
66	Autosomal recessive hypophosphatemic rickets 2	613312	<i>ENPP1</i>
67	Autosomal recessive intermediate Charcot-Marie-Tooth disease type A	608340	<i>GDAP1</i>
68	Autosomal recessive limb-girdle muscular dystrophy type 2I	607155	<i>FKRP</i>
69	Autosomal recessive limb-girdle muscular dystrophy type 2M	611588	<i>FKTN</i>
70	Autosomal recessive limb-girdle muscular dystrophy type C	613157	<i>POMGNT1</i>
71	Autosomal recessive limb-girdle muscular dystrophy type C	609308	<i>POMT1</i>
72	Autosomal recessive limb-girdle muscular dystrophy type C	613158	<i>POMT2</i>
73	Autosomal recessive malignant osteopetrosis 1	259700	<i>TCIRG1</i>
74	Autosomal recessive malignant osteopetrosis 4	611490	<i>CLCN7</i>
75	Autosomal recessive nonsyndromic sensorineural deafness type DFNB12	601386	<i>CDH23</i>
76	Autosomal recessive nonsyndromic sensorineural deafness type DFNB18	602092	<i>USH1C</i>

77	Autosomal recessive nonsyndromic sensorineural deafness type DFNB1A (gene GJB2)	220290	GJB2
78	Autosomal recessive nonsyndromic sensorineural deafness type DFNB2	600060	MYO7A
79	Autosomal recessive polycystic kidney disease	263200	PKHD1
80	Autosomal recessive progressive external ophthalmoplegia	258450	POLG
81	Autosomal recessive spastic ataxia of Charlevoix-Saguenay	270550	SACS
82	Autosomal recessive spondylocostal dysostosis 1	277300	DLL3
